

Practical No. 3

Aim: To understand the SaaS delivery model and deploy a G Suite cloud-based application that can be accessed by end users through a web browser without local installation.

Theory:

Software as a Service (SaaS), also called **On-Demand Software**, is a cloud computing model in which applications are hosted by a cloud service provider and delivered to users over the internet. Users can access these services through a web browser without installing or maintaining software on their local systems.

Services Provided by SaaS

- **Business Services:** ERP, CRM, billing, and sales applications
- **Document Management:** Creating, storing, and managing electronic documents
- **Mail Services:** Cloud-based email services for large numbers of users

Advantages of SaaS

- Easy and low-cost subscription-based access
- One-to-many model (single application instance shared by many users)
- No need for additional hardware or local installation

Disadvantages of SaaS

- Data security concerns
- Complete dependency on internet connection

Popular SaaS Providers

- Salesforce.com – CRM solutions
- Microsoft Office 365 – Online office suite
- Google Workspace – Gmail, Drive, Docs, etc.

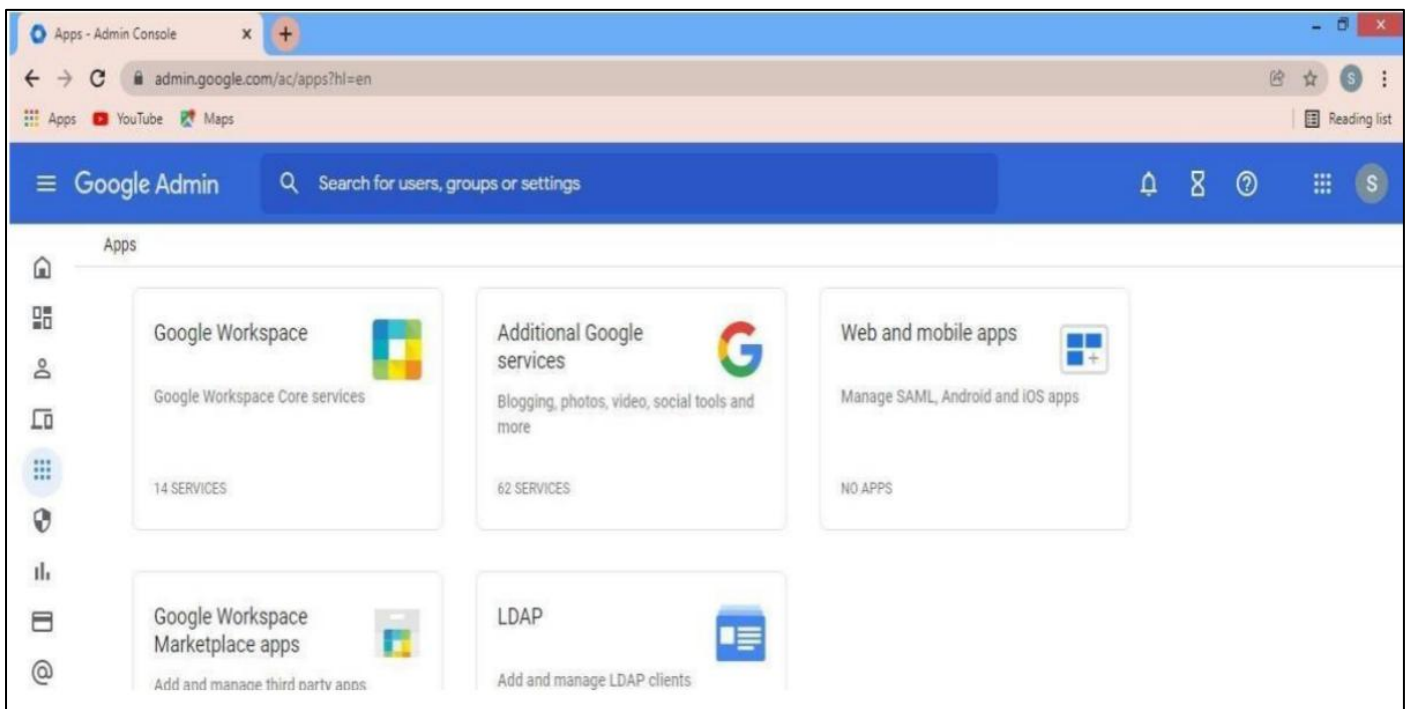

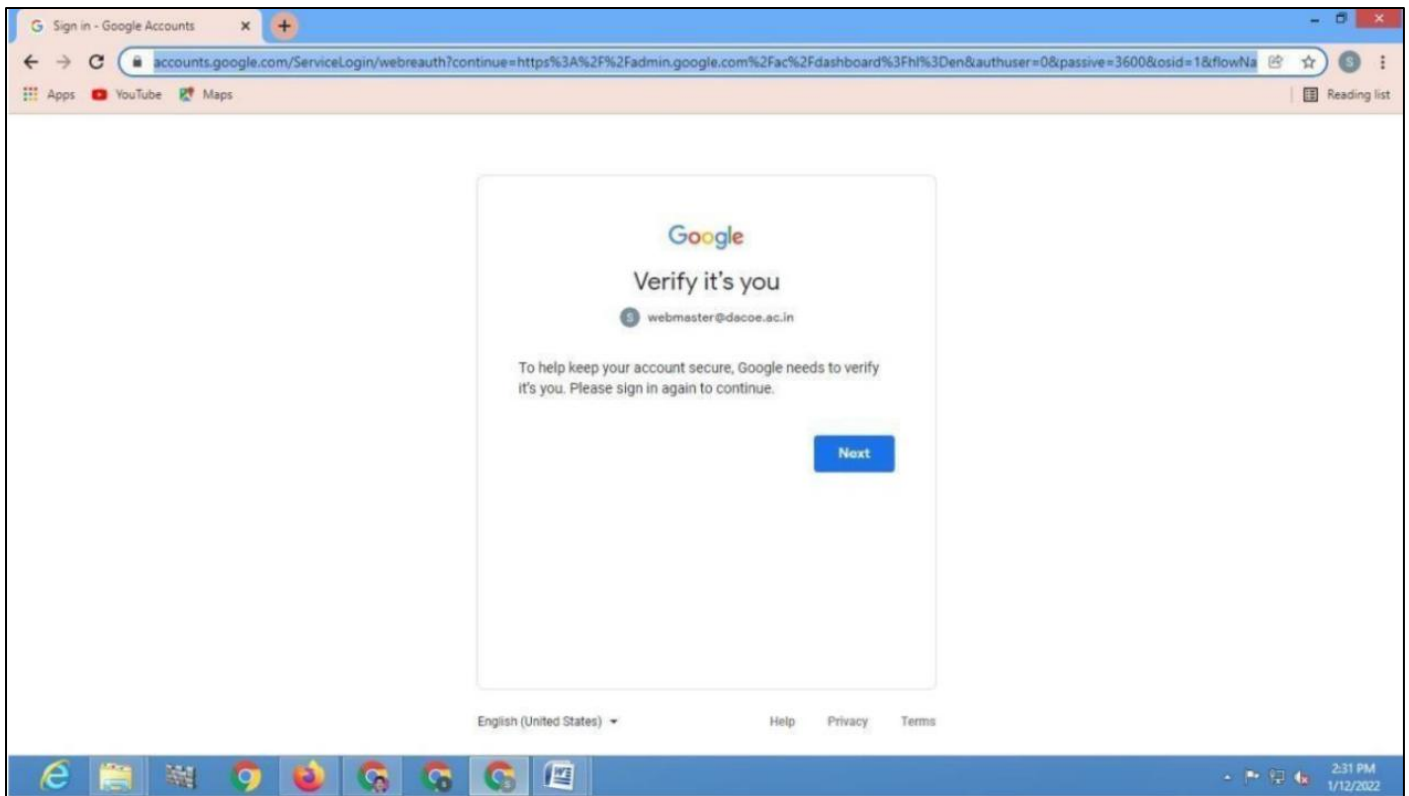

Example: Google Workspace is a cloud-based SaaS platform providing applications such as Gmail, Google Drive, and Google Docs that are accessed through a web browser. It supports communication, file storage, and real-time collaboration without local installation.

How to start using G Suite:

Sign in to your G Suite administrator account and set up your first users. You can manage all of the G Suite services for your business, including mobile device management, data migration, setting password requirements, and much more. This guide walks you through the admin sign-in process.

After you sign in, you will need to set up your G Suite account by:

- verifying you own your domain,
- adding user accounts for your employees, and
- when all employees have been added, setting up Gmail as your email client by updating your MX records. Don't worry, none of these changes will affect your website, if you have one.

Conclusion: Thus, we have successfully studied and implemented Software as a Service (SaaS).
