

Experiment No. 6

Aim: Build a React Component (Functional + Props + State) and Fetch API Data Using useEffect

Program:

1. App.js

```
import React, { useEffect, useState } from
"react";
import UserCard from "./UserCard";
import "./App.css";
```

```
function App() {

  const [users, setUsers] = useState([]);
  const [loading, setLoading] =
useState(true);

  useEffect(() => {

    fetch("https://jsonplaceholder.typicode.co
m/users")
```

```
.then((response) => response.json())
.then((data) => {
  setUsers(data);
  setLoading(false);
});
}, []);

return (
<div className="app">
  <h2>Users List (API Fetching)</h2>

  {loading ? (
    <p>Loading data...</p>
  ) : (
    <div className="user-list">
      {users.map((user) => (
        <UserCard
```

```

        key={user.id}
        name={user.name}
        email={user.email}
        city={user.address.city}
      />
    ))}
  </div>
)}
</div>
);
}

```

```
export default App;
```

2.App.css

```

body {
  background: #f0f2f5;
  font-family: Arial, Helvetica, sans-serif;
}

```

```

.app {
  text-align: center;
  padding: 30px;
}

```

```

.user-list {
  display: grid;
  grid-template-columns: repeat(auto-fit,
minmax(250px, 1fr));
  gap: 20px;
  margin-top: 30px;
}

```

```

.card {
  background: white;
  padding: 20px;
  border-radius: 10px;
  box-shadow: 0 0 15px rgba(0,0,0,0.1);
  transition: 0.3s;
}

```

```

.card:hover {
  transform: scale(1.05);
}

```

3.UserCard.js

```
import React from "react";
```

```

function UserCard(props) {
  return (
    <div className="card">
      <h3>{props.name}</h3>
      <p>Email: {props.email}</p>
      <p>City: {props.city}</p>
    </div>
  );
}

```

```
export default UserCard;
```
